

Final Features to Complete. *Feel free to suggest improvement*

Authentication & Password System

Complete and test:

- Admin reset password
- User change password from Settings page
- Forgot password from Login page
- Email password reset link
- Password reset token expiration
- Secure password hashing using bcryptjs
- Proper error messages for failed login/reset attempts

The Change Password button should remain inside the Settings page, not the sidebar.

The Forgot Password link should appear on the Login page.

Email Notifications

SMTP is already tested and working. Complete automatic email triggers for:

- Service request submitted
- Request approved
- Project created
- Project updated
- Invoice generated
- Project completed
- New project message

Each email should include clear JPS branding, customer name, service/project/invoice details, and a link back to the portal.

Role-Based Access

Final Features to Complete. *Feel free to suggest improvement*

Complete frontend and backend role protection.

Roles:

- ADMIN
- CLIENT
- STAFF
- MARKETING
- SUBCONTRACTOR

Clients must not access:

- Users
- Admin Requests
- Admin Services
- Email Campaigns
- Admin-only API routes

Backend API routes must enforce role permissions, not only hide menu items in the frontend.

Dashboard

Dashboard API is already working. Finalize dashboard cards for:

- Active projects
- Service requests
- Invoices
- Revenue
- Unread notifications
- Open tickets or messages

Make sure data refreshes properly and does not show hardcoded values.

Final Features to Complete. *Feel free to suggest improvement*

Invoices

Confirm and finalize:

- Generate invoice from project
- Optional fields: domain, hosting, shipping, installation, tax, discount, due date, notes
- Edit invoice
- Save invoice
- Mark sent
- Mark paid
- Print/download PDF
- Email invoice to customer
- Invoice notification in portal

Projects

Confirm and finalize:

- Create project from approved service request
- Prevent duplicate project creation
- Project details page
- Project progress/status update
- Project timeline
- File upload/delete
- Project messages
- Project update notification
- Project update email

Service Requests (Change to request Service)

Confirm and finalize:

- Customer submits request
- Admin approves/rejects
- Approved request can create project
- Rejected request stores status
- Email customer when request is submitted
- Email customer when request is approved/rejected

Final Features to Complete. *Feel free to suggest improvement*

Notifications

Current notification center works. Finalize:

- Bell icon
- Unread count
- Dropdown
- Mark as read
- Notification records for important events
- Customer-specific notifications instead of test userId only

2. Production Database

Current development database is SQLite. Production must use MySQL.

Developer must:

- Configure MySQL database
- Update DATABASE_URL
- Run Prisma migration for production
- Seed first ADMIN user
- Confirm all models work in MySQL
- Confirm file uploads and invoice/project records persist correctly
- Create backup and restore plan

Production database must not rely on local SQLite.

3. Deployment Requirements

Deploy the portal using these subdomains:

- app.jpssupport.com for the React frontend
- api.jpssupport.com for the Express API

Frontend

Final Features to Complete. *Feel free to suggest improvement*

- Run production build with `npm run build`
- Deploy the dist folder to the frontend hosting location
- Configure Vite environment variables so frontend calls `https://api.jpssupport.com`
- Confirm browser routes work after refresh

Backend

- Deploy Express API on server
- Configure Node environment
- Run API using PM2 or another process manager
- API must automatically restart after crash or server reboot
- Configure logs
- Confirm all routes work from live domain

SSL

- Install SSL for both `app.jpssupport.com` and `api.jpssupport.com`
- Force HTTPS
- Confirm login, email, file upload, and invoices work over HTTPS

Environment Variables

Production `.env` must include:

- `DATABASE_URL`
- `JWT_SECRET`
- `SMTP_HOST`
- `SMTP_PORT`
- `SMTP_SECURE`
- `SMTP_USER`
- `SMTP_PASS`
- `SMTP_FROM`
- `FRONTEND_URL`
- `API_URL`
- `NODE_ENV=production`

Do not hardcode credentials in source files.

Final Features to Complete. *Feel free to suggest improvement*

4. Security Requirements

Before launch, complete:

- JWT expiration
- Protected API routes
- Admin middleware
- Client middleware
- Password hashing
- File upload size limit
- File upload extension restrictions
- CORS locked to the correct domains
- Input validation
- Error handling without exposing server secrets
- Prevent clients from accessing other customers' projects/invoices/files
- Protect .env and database credentials

5. QA Testing Required

Perform full end-to-end testing:

Authentication

- Register
- Login
- Logout
- Admin reset password
- User change password
- Forgot password email
- Reset password from email

Users

- View users
- Edit role
- Edit segment
- Disable user
- Reset password

Final Features to Complete. *Feel free to suggest improvement*

Services

- View services
- Submit service request
- Admin approve/reject request

Projects

- Create project from approved request
- Duplicate project prevention
- Update status
- Update progress
- Timeline entries
- Upload files
- Delete files
- Send project message

Invoices

- Create invoice
- Edit optional fields
- Save invoice
- Mark sent
- Mark paid
- Print/download PDF
- Email invoice

Notifications

- Bell count
- Dropdown
- Mark as read
- Project update notifications
- Invoice notifications

Email

- SMTP test
- Service request email
- Project update email
- Invoice email
- Password reset email

Final Features to Complete. *Feel free to suggest improvement*

Mobile

Test on:

- iPhone
- Android
- Tablet
- Desktop Chrome
- Desktop Safari

6. What Developer Must Provide Me After Launch

The developer must provide the following:

Access & Credentials

- Admin portal login
- Database name and location
- MySQL username, password, host, and database name
- Server path for frontend files
- Server path for backend files
- PM2 app name
- SMTP email account used by the portal
- Any deployment account or panel details used
